SUMMARY

Fullstack Engineer with 1+ year of experience building scalable, production-ready systems across authentication, real-time systems and full-stack features from database schema to deployment. Deployed Keycloak SSO to 1,000+ users, shipped a developer tooling Chrome extension to the Web Store and built a WebSocket trading platform achieving sub-100ms tick-to-browser latency.

SKILLS

Languages : Python, TypeScript, JavaScript
Frontend : Next.js, React, Tailwind CSS
Backend : Laravel, Node.js, FastAPI
Databases : MySQL, MongoDB, PostgreSQL, Redis
Devops : AWS, Docker, CI/CD, GitHub Actions

EXPERIENCE

Nantech Solutions

May 2025 - July 2025

Software Developer Intern

- Designed and deployed a Keycloak-based centralised authentication system across 3 enterprise applications serving SSO for 1,000+ users, covering user lifecycle management, password reset flows, and 2FA enrollment.
- Implemented fine-grained RBAC with realm and client-level roles, brute force protection, single active session enforcement, Single Sign-Out, and admin-level session revocation, with full client configuration covering redirect URI whitelisting and token lifetime policies.

Chromosis Technologies

Sept 2025 - Present

Software Engineer

- Shipped production features end-to-end on a multi-module enterprise SaaS platform covering audits, project planning, risk management, dashboards, and PLD workflows across 39+ route-level screens using React (TypeScript) and Laravel. Owned features end-to-end from database schema design and API development through frontend integration and deployment handoff using GitHub-based workflows.
- Built a dynamic Excel generation and live preview pipeline with configurable column/row layouts and client-specified formatting rules, alongside a server-side PDF generation feature integrated into the platform's document export flow. Improved usability of data-heavy enterprise workflows by implementing debounced auto-save, dirty-state tracking, filtering, sorting, and pagination across multiple high-interaction modules.

PROJECTS

IndiaTradeX — Real-Time Simulated Indian Stock Trading Platform (React, FastAPI, PostgreSQL, WebSockets, Redis) [[Link](#)] [[Github](#)]

Designed a full-stack real-time stock trading simulator end-to-end streaming live simulated NSE/BSE-style tick prices to concurrent WebSocket clients via Redis pub/sub fan-out, achieving sub-100ms tick-to-browser latency.

- Engineered a Geometric Brownian Motion (GBM) tick simulation engine generating statistically realistic price movements only for user-selected stocks with per-sector volatility profiles, circuit breaker logic, and IST market-hours enforcement.
- Implemented demand-driven stock subscriptions using a Redis reference-count system, activating the tick simulator only for stocks users are actively watching — eliminating unnecessary computation and keeping the system resource-efficient at scale.
- Built a virtual order execution engine simulating NSE-realistic charges (STT, SEBI fees, GST, brokerage) with atomic wallet debit and portfolio upsert inside DB transactions, and real-time P&L recalculation per tick using Redis-cached prices with sub-5ms response time.

HireFlow — AI-Powered Applicant Tracking System (React, Node.js, Express, MongoDB, OpenAI) [[Link](#)] [[Github](#)]

Developed a full-stack ATS implementing RBAC with JWT refresh token rotation and bcrypt auth across Admin, Recruiter, and Viewer roles.

- Engineered an AI resume scoring pipeline with extracting PDF text, generating OpenAI embeddings, and computing cosine similarity against job descriptions to produce a 0–100 match score displayed on every candidate card.
- Built a drag-and-drop Kanban pipeline board using @dnd-kit with real-time stage transitions, bulk actions, audit-logged history, and AI score-based sorting — demonstrating end-to-end product ownership across backend and frontend.

API Debugger — Real-Time Network Debugging Chrome Extension (React, TypeScript, Chrome MV3, Vite, Shadow DOM) [[Link](#)] [[Github](#)]

Engineered and shipped a Chrome MV3 extension to the Web Store that intercepts fetch/XHR calls via JS Proxy injection and surfaces real-time API debugging in a Shadow DOM overlay — no DevTools required.

- Built a three-layer timing system combining a fetch/XHR proxy, PerformanceObserver resource entries (TTFB, DNS, SSL, transfer size), and chrome.debugger CDP — merged in the service worker to produce DevTools-comparable latency measurements.
- Architected a scored dependency inference engine extracting signals from URLs, request bodies, and JSON response values — surfacing causal API call chains as an SVG dependency graph with node size encoding call frequency and edge colour encoding latency.

EDUCATION

KLS Gogte Institute of Technology, Belgaum

Feb 2024 - Nov 2025

Master of Computer Application

OPEN SOURCE & ACHIEVEMENTS

- Contributed to IP Query([#226](#)), Job Ops([#552](#)), and CacheLib([#112](#)) and many more through feature improvements and issue fixes.
- Earned UI/UX certification([2025](#)) from NASSCOM focused on user-centered design principles and interface design.
- Wrote and published engineering blogs([Link](#)) covering authentication architecture, CLI tool development, real-time systems etc.
